

Panagiotis Chatzikallias

Software Engineer | Backend & Full-Stack

Thessaloniki, Greece | +30 697 465 2888 | panoschatzikallias@gmail.com | linkedin.com/in/panagiotischatzikallias | github.com/ApparentlyPlus | whoareyou.plus

Summary

Software engineer who works from the browser down to the bootloader, in **Python, Java, C#** and **C**. Contributor to **.NET** and **CPython**.

Education

B.S. in Computer Science, University of Macedonia — **GPA 8.5/10**

Expected 2027

- Coursework and thesis complete as of 2026; conferred 2027 by national rule on thesis defence. **Available for full-time work now.**

Projects

PawStack — a toolchain where your program is the operating system (*B.S. Thesis*)

2024 – 2026

- Most operating systems run any program. PawStack inverts that: you write one program and the toolchain builds the smallest system that can run it. Written solo in **C, C#, .NET** and **x86 Assembly**, with **CI/CD** on Linux, Windows and macOS.

Speedmap — a national map of what broadband you can actually get

2026

- Used **Python, FastAPI, PostgreSQL, PostGIS, SQL, REST APIs, HTML, CSS** and a **TypeScript / Node.js** frontend to join Greece's national coverage register to street geometry and measured speeds, so anyone can see the fastest line actually available at their address instead of an operator's sales page.
1.8M addresses and 12.8M coverage rows, behind 57 checksummed migrations, a generated API contract and automated testing on every build. Grew out of **ISPRadar**, the **React, Java** and **Spring Boot** prototype built for a university assignment.

UniNotes — collaborative study platform (*co-authored*)

2024

- Used **C#, .NET, Blazor, MongoDB, SQL** and **REST APIs** to build a platform where a class writes and shares course notes in real time behind full authentication, replacing scattered personal files. Built with another developer and used by students at my university.

Self-hosted infrastructure — public server running my live services

2024 – Present

- Used **nginx, Linux, Docker, DNS, TLS** and **DevOps** practice to run my site and several services behind a reverse proxy on a public address.

Open Source

Contributor — [dotnet/runtime](#), [dotnet/arcade](#), [CPython](#), [myuom](#)

2025 – Present

- Used **C#, .NET, C, Python, Git** and **GitHub** to get code merged into **.NET**, the runtime behind every C# program that ships, and its build infrastructure, reviewed by the Microsoft engineers who maintain them. Also contributing to **CPython**, the reference Python implementation, and to a student platform used at my university.

Experience

HackTheBox — *Content Engineer (paid contract)*

2024

- Used **Python** and applied cryptography to design and ship a security challenge to HackTheBox's live commercial platform under paid contract, giving the company new material for its subscribers. **339 users solved it; rated 4.9/5 across 119 reviews.**

Technical Skills

Languages: Python, Java, C#, C, TypeScript, JavaScript, SQL, C++, HTML, CSS, x86 Assembly

Frameworks: Spring Boot, FastAPI, .NET, ASP.NET, Blazor, React, Node.js, Flask, ONNX

Tools & Practices: Git, GitHub, CI/CD, DevOps, Agile, Docker, Linux, REST APIs, automated testing, Maven

Data & Infrastructure: PostgreSQL, PostGIS, MongoDB, nginx, reverse proxy, TLS, DNS, systemd, Linux / Unix administration

Honors

- National Team Member for Greece**, European Cyber Security Challenge: qualified 3rd nationwide, placed 11th of 28 nations. **CVE approved** for a coordinated disclosure in an app with 100k+ downloads, driven to a released fix with the vendor and MITRE.
- 10th of 955 teams from 94 countries** at the HackTheBox University CTF. **ICPC Regional Finalist** (SEERC 2025). **2nd of 40+ teams**, Apps4Athens 2025.
